SRIJAN

SHIFT FROM REACTIVE ADMINISTRATION TO PREDICTIVE PARTICIPATION GOVERNANCE.

State-wise Average Turnout

Average Margin of Victory (%)

3.95

Constituencies at Risk (FY 2021)

145

High Priority Constituencies (FY 2021)

297

Average Electorate Size

228.41K

Average Voter Turnout (%)

70.03

High-Impact Low Participation States

BIHAR

- Lowest average turnout across Assembly Constituency types.
- High electorate volume → large absolute non-voter base.
- Indicates systemic mobilisation and awareness deficit.

UTTAR PRADESH

- **Large electorate with uneven performance distribution.**
- While it has strong Tier 4 clusters, turnout scalability remains inconsistent.

MAHARASHTRA

- Similar large-scale structural stress patterns.

Implication: **Population scale is amplifying participation inefficiency.**

Structural Participation Gaps – State-Level Findings

West Bengal & Assam – The Structural Paradox

- West Bengal Avg Turnout: ~85%
- Assam Avg Turnout: ~84%
- Yet high concentration of Tier 1 districts (297 districts nationally in 2021 flagged for immediate attention)

Interpretation: **High turnout does not imply structural resilience.**

West Bengal:

- 32.18% Type 1 voters (among highest nationally)
- Heavy dependence on consistent voter base
- **Limited expansion beyond core electorate**

Risk = Over-reliance on habitual voters + potential marginal voter disengagement.

Tier Distribution – Risk Segmentation Model

Constituencies are classified using a composite participation risk index based on:

- Turnout Level
- Turnout Trend (Decline/Stability)
- Core Voter Base (Type 1 %)
- Volatility Indicators
- Electorate Growth Stress

Jammu & Kashmir – Structural Participation Breakdown

- Type 1 voter share: 0.02% (lowest nationally)
 - **Indicates absence of stable voter participation culture**
 - Likely influenced by trust, access, and law & order constraints
- Similar patterns (though less extreme) observed in:
- Jharkhand
 - Bihar
 - Parts of Uttar Pradesh

This requires institutional, not just communication, intervention.

Constituencies at Risk of Participation Decline Requiring Targeted Intervention

Priority Tier Distribution

Recommendations

1. Targeted State-Level Intervention Framework

Move from uniform national campaigns to differentiated state strategies:

- Bihar & UP → Mass awareness + behavioural mobilisation.
- J&K & high-fragility zones → Trust and accessibility rebuilding.

3. Expand Beyond Core Voter Dependency

In states like West Bengal:

- Reduce over-reliance on Type 1 habitual voters.
- Develop engagement strategies for marginal and first-time voters.
- Build sustainable participation elasticity.

2. Tier-Based Resource Allocation Model

Allocate operational resources based on Tier classification:

- Tier 1 → Immediate ground mobilisation + booth-level intervention.
- Tier 2 → Preventive stabilisation campaigns.
- Tier 4 → Codify and replicate best practices nationally.

4. Institutional Early-Warning Monitoring System

Implement real-time tracking of:

- Turnout Change %
- Electorate Growth %
- Type 1 Share Variability
- Margin Volatility

Executive Summary

PARTICIPATION
TRENDS

Priority
Model

Cluster
Insights

Final
Strategy

PRIORITISE THE 475 DECLINING DISTRICTS. SHIFT FROM NATIONAL AVERAGES TO DISTRICT-LEVEL PREDICTIVE MONITORING.

COMPETITIVENESS DRIVES ENGAGEMENT — BUT NOT UNIFORMLY

Average Margin of Victory: 3.95%

Scatter evidence shows:

- Lower margins correlate with higher turnout.
- Highly competitive constituencies cluster above 75% turnout.
- However, competitiveness alone does not prevent decline in Type 3 clusters.

CANDIDATE FRAGMENTATION DILUTES MOBILISATION EFFICIENCY

Number of Candidates vs Turnout shows:

- Weak negative slope.
- Turnout compression beyond ~20–25 candidates.
- Fragmented ballots correlate with reduced participation clarity.

Interpretation:
Excessive contest density reduces marginal turnout efficiency.

PARTICIPATION MOMENTUM IS CYCLICAL — NOT LINEAR

National Average Turnout: 70.03%

However, trend analysis shows sharp fluctuations:

- 2010 dip: ~55%
- Recovery peaks: ~79%
- 2020 drop: ~58%
- Latest rebound: ~77%

Signal:
Turnout is structurally volatile across cycles.
475 districts are in sustained decline trajectory.
Aggregate stability masks district-level erosion.

ELECTORATE SCALE IS NOT THE PRIMARY CONSTRAINT

Average Electorate Size: 228K

Large constituencies (>400K electors):

- Show participation compression.
- Display higher turnout variance.
- Concentrate in Tier 2 and Tier 3 segments.

However:
Several high-density seats sustain 75–85% turnout.

Type 1: Constituencies with consistently high and stable voter turnout across elections.
Type 2: Constituencies showing a clear declining trend in voter participation over time.
Type 3: Constituencies with highly volatile turnout, fluctuating significantly between elections.
Type 4: Constituencies with persistently low voter turnout and no meaningful recovery pattern.

National turnout reporting -----> District-level predictive diagnostics

Establish a Declining-District Taskforce

Focus on the 475 declining districts.
Mandate:

- Root-cause diagnostics
- Booth-level participation audits
- Quarterly risk tracking

Reverse multi-cycle decline before escalation.

Cap Mobilisation Fragmentation RiskMonitor

constituencies exceeding candidate-density thresholds.
Deploy:

- Simplified voter communication
- Ballot literacy programs
- Targeted mobilisation drives

Reduce confusion-induced participation compression.

Introduce a District-Level Competitiveness Index

Integrate:

- Margin of victory %
- Turnout change %
- Candidate density

Identify districts where competitiveness is not translating into engagement.

Implement Predictive Turnout Compression Alerts

Trigger intervention when:

- Electorate growth > turnout growth
- Turnout decline > 1.5%
- Volatility exceeds threshold
- Multi-cycle downward slope detected

Identify districts where competitiveness is not translating into engagement.

RECOMMENDATIONS

WHAT SHOULD THE ELECTORAL AUTHORITY DO NEXT?

Participation Risk Quadrant

● Tier 1 – Immediate Attention ● Tier 2 – Monitor Closely ● Tier 3 – Stable ● Tier 4 – High Performing

Avg Priority Score

37.12

Highest Risk Score

68.21

Observations from Quadrant:

1. Tier 1 (Red Cluster – Immediate Attention)

- a. Concentrated between 65–85% turnout
- b. Volatility generally below 10 STD
- c. Structural decline rather than chaos

2. High-Volatility Outliers (Upper Band >40 STD)

- a. Turnout instability exceeding 50 STD in some seats
- b. Predictability collapse in participation behavior

3. Tier 4 (Green Cluster – High Performing)

- a. 70–85% turnout
- b. Volatility tightly compressed below 5 STD
- c. Participation consistency, not just volume

Top 20 Constituencies Requiring Immediate Attention

state_name	Constituency	priority_score	priority_rank	Avg Turnout	avg_turnout_change	turnout_std	candidate_type
Arunachal Pradesh	Yachuli	68.21	1	68.28	-41.18	50.52	ST
Arunachal Pradesh	Dirang	67.66	2	28.35	-42.53	49.10	ST
Arunachal Pradesh	Along East	66.06	3	60.77	-36.80	44.44	ST
Nagaland	Northern Angami-II	60.11	4	72.74	-46.99	52.58	ST
Uttar Pradesh	Sahibabad	54.29	5	49.26	-0.11	0.08	GEN
Maharashtra	Khadakwasala	53.49	6	48.39	0.68	9.56	GEN
Jharkhand	Hatia	53.34	7	48.33	5.59	9.86	GEN
Maharashtra	Kalyan West	53.16	8	43.89	-1.53	1.72	GEN
Jammu And Kashmir	Hazratbal	53.15	9	26.98	9.23	6.53	GEN
Maharashtra	Ulhas Nagar	52.67	10	40.71	4.95	5.41	GEN

TOP 20 HIGH-RISK CONSTITUENCIES – SEVERITY ANALYSIS

Top Scores:

- Yachuli (Arunachal Pradesh): 68.21
- Dirang: 67.66
- Along East: 66.06
- Northern Angami-II (Nagaland): 60.11

Common Risk Attributes:

- Turnout change: **-36% to -46%**
- Volatility STD: 44–52
- Repeated negative momentum across cycles**

Priority Score Formula: Priority

Score = (Low Turnout Score × 0.30) + (Decline Score × 0.20) + (Volatility Score × 0.20) + (Large Electorate Score × 0.15) + (Competitiveness Score × 0.15)

Weights reflect relative severity of each participation risk dimension.
Total = 1.0

INSTITUTIONALISE THE PRIORITY SCORE AS A NATIONAL ELECTORAL KPI

Mandate:

- Quarterly Priority Score publication
- District-level risk dashboards
- Integration into administrative review cycles

Move risk from analytical insight to governance metric

DEPLOY RAPID STABILISATION PROTOCOL FOR 297 TIER 1 SEATS

Intervention Toolkit:

- Booth-level turnout diagnostics
- Accessibility and logistics audit
- Targeted awareness drives
- Local stakeholder engagement

Reduce Priority Score in Tier 1 seats by 20% within one election cycle.

VOLATILITY CONTAINMENT IN HIGH-STD CONSTITUENCIES (>40 STD)

Compress volatility band below 15 STD.

Focus on outlier cluster:

- STD levels between 44–52
- Turnout swings >35%

Deploy:

- Micro-level voter mapping
- Confidence-building measures
- Administrative continuity programs

RECOMMENDATIONS

PREDICTIVE TIER MIGRATION MONITORING

Establish automatic escalation triggers:

If:

- Turnout decline exceeds threshold
- Volatility spike >20 STD increase
- Risk score crosses 50

Then:

- Escalate to Tier 1
- Trigger district-level review

Prevent emerging decline from becoming structural collapse.

Executive Summary

Participation Trends

Priority Model

Cluster Insights

FINAL STRATEGY

FORWARD-LOOKING RISK & EARLY WARNING SYSTEM

Turnout Trend vs Volatility Risk Map

● Tier 1 – Immediate Attention ● Tier 2 – Monitor Closely ● Tier 3 – Stable ● Tier 4 – High Performing

Quadrant Interpretation:

- **Negative** Turnout Change + **High** STD
→ Structural decay (highest intervention priority)
- **Positive** Change + **High** STD
→ Temporary spikes, unstable base
- **Negative** Change + **Low** STD
→ Silent erosion (most dangerous long-term risk)
- **Positive** Change + **Low** STD
→ Structural resilience

Key Insight:

Seats do not collapse suddenly.
• They migrate across quadrants gradually.

Axes:

- X: Avg Turnout Change %
- Y: Turnout STD

Participation Lifecycle Status

Declining Participation Seats
475

Critical Risk Constituencies
145

High Volatility Seats
264

PARTICIPATION RISK PIPELINE

- Current Status:
- 1,290 constituencies on declining participation trajectory
 - 1,321 constituencies exhibiting high volatility
 - 403 constituencies already in critical risk zone
 - Lifecycle distribution: **(FY 2021)**
 - Stable: ~ 562
 - Volatile: ~ 264

RISK ESCALATION DYNAMICS

- Pattern Observed:
Declining → Volatile → Critical
- Without early intervention:
- Tier 2 seats migrate to Tier 1
 - Volatile lifecycle seats increase
 - Administrative bandwidth gets overloaded

Structural Risk by Cluster Type

cluster_label	Avg Turnout	Average Volatility	Average turnout STD
Type 1	78.51	0.04	2.27
Type 2	64.21	0.07	3.68
Type 3	87.37	0.53	28.69
Type 4	80.43	0.10	5.23
Unclassified	75.50		

Election-year mobilisation → Continuous participation risk surveillance.

Establish a National Participation Early Warning Dashboard

- Monitor 4 Core Indicators Monthly:
- Turnout Change %
 - Turnout Volatility (STD)
 - Electorate Growth %
 - Cluster Migration Status

Introduce Quadrant-Based Intervention Triggers

- Deploy:
- Intensive voter mapping
 - Administrative continuity review
 - Infrastructure confidence measures
 - Community-level engagement drives

Protect the 2.8K Stable Constituencies

- If:
- Turnout Change < -1.5%
 - STD > 20 threshold
 - Two consecutive cycles of decline
- Then:
Automatic escalation to Preventive Stabilisation Protocol.

Stabilise Type 3 Constituencies (STD ~47)

- Do not overallocate resources to stable zones.
Focus:
- Maintain low STD (<5)
 - Document operational best practices
 - Replicate into volatile districts

STRUCTURAL RISK BY CLUSTER TYPE

Cluster Analysis:

- **Type 1:** Avg Turnout 77.82%, STD 2.03
→ Structurally stable
- **Type 2:** Avg Turnout 60.05%, STD 2.58
→ Growth opportunity, low volatility
- **Type 3:** Avg Turnout 62.75%, STD 47.36
→ Extreme volatility, highest systemic risk
- **Type 4:** Avg Turnout 73.94%, STD 5.03
→ High turnout, moderate variance

Executive Summary

FINAL STRATEGY

FINAL STRATEGY

Precision Targeting Through Tiered Governance

Problem :

- 475 districts are declining.
- 145 districts flagged for immediate attention.
- High variation across states (e.g., UP vs West Bengal contrast).

Strategic Actions:

Tier-Based Operating Model

Tier 1 – Immediate Intervention

- Booth-level mobilisation drives.
- On-ground awareness campaigns.
- Real-time district monitoring cell.
- Monthly turnout-risk tracking.
- Escalate automatically if Priority Score crosses 50.

Tier 2 – Preventive Stabilisation

- Youth engagement campaigns.
- Civic literacy reinforcement.
- Community-level nudging.
- Quarterly volatility checks — escalate to Tier 1 if STD rises >20.

Tier 3 – Stability Maintenance

- Monitor turnout volatility.
- Maintain awareness presence.

Tier 4 – High-Performing Replication

- Document best-performing districts.
- Identify replicable drivers (competition intensity, booth density, engagement models).
- Scale learnings nationally.
- Tier 4 districts serve as intervention templates, not just benchmarks.

Scalability Reform for Large Electorates

Problem :

- Turnout declines as total electors increase.
- Large constituencies (>400K electors) show compression in participation.
- Electorate growth is outpacing engagement capacity.

Strategic Actions

A. Booth Infrastructure Scaling

- Target booth density: 1 per 1,200 electors in high-growth constituencies.
- Geographic mapping of high-density clusters.
- Urban micro-zoning to reduce voter-to-booth travel distance.
- Increase polling staff proportional to electorate growth rate.

B. Technology-Led Outreach

- Data-driven voter nudges based on Type 2 and Type 3 cluster profiles.
- SMS and app-based reminders targeted to non-habitual voters.
- Location-based awareness messaging in >400K electorate zones.

C. Urban Mobilisation Framework

- Special focus on peri-urban constituencies showing turnout compression.
- Youth and first-time voter drives in high-growth electorate seats.
- Peer-community engagement over institutional campaigns.

Behavioural Diversification of the Voter Base

Problem :

- States like West Bengal show high turnout (~85%) but high Tier 1 exposure.
- Heavy reliance on Type 1 habitual voters (32.18% in WB).
- Jammu & Kashmir shows near absence of consistent voter base (0.02%).

Strategic Actions:

A. Reduce Core Voter Dependence

Target:

- Type 2 (intermittent voters)
- Type 3 (occasion-based voters)

Convert occasional voters into habitual voters.

- Reduce West Bengal-style Type 1 over-reliance below 25% share in high-dependency states.

B. Youth & First-Time Voter Integration

- Institutional partnerships (colleges, digital platforms).
- Simplified voter education programs.
- First-time voter recognition drives tied to local community identity

C. Trust Restoration Zones

For structurally weak regions:

- Accessibility expansion — additional booths, extended hours.
- Law & order reinforcement coordination with local administration.
- Community trust-building engagement through neutral civic institutions.
- Multi-cycle confidence building — measure Type 1 share growth annually.

Predictive Early-Warning & Participation Intelligence System

Risk Indicators:

- 475 declining seats
- 264 high volatility seats
- 145 already critical
- Margin of victory average: 3.95% (high competitive sensitivity)

Strategic Shift

Build a Participation Risk Intelligence Engine.

Monitor 4 Core Indicators

1. Turnout Change %
2. Electorate Growth %
3. Type 1 Share Variability
4. Margin Volatility

Operational Mechanism

- District-level risk score generation (Priority Score = Low Turnout×0.30 + Decline×0.20 + Volatility×0.20 + Electorate×0.15 + Competitiveness×0.15)
- Risk heatmaps for real-time visualisation.
- Automatic Tier migration alerts.
- Quarterly performance review dashboards.

Intervention Trigger Logic if:

- **Turnout decline > 1.5% (avg cycle-on-cycle change)**
- **Electorate growth > 15.2% (cycle-on-cycle)**
- **Turnout STD > 3.7% (volatility spike)**

Then:

- Automatic escalation to Tier 1.
- Trigger district-level review within 30 days.
- Reallocate resources from stable Tier 3/4 zones dynamically.

Thank You
